# About This Report

---

## Scope & Method

This report forecasts to 2021 industrial enzymes demand and production in nominal US dollars at the manufacturer level in Canada. Total demand is segmented by market in terms of:

- food and beverages
- biofuel production
- cleaning products
- animal feed
- other markets such as pulp and paper, textiles and leather, cosmetics and toiletries, oilfield applications, and wastewater treatment

To illustrate historical trends, total demand is provided in annual series from 2006 to 2016; total production and the various segments are reported at five-year intervals for 2006, 2011, and 2016.

Industrial enzymes include those that remain in the product at the end user level – such as in animal feed, detergents, or personal care products – as well as enzymes consumed during the manufacturing of other materials, for example in biofuel production, food and beverage processing, starch processing, textile and leather production, and pulp and paper manufacturing. Most industrial enzymes are relatively commoditized products, produced and consumed on a fairly large scale, and hence are much less expensive than specialty enzymes used in research and medicine (not covered in the current report).

This report quantifies trends in various measures of growth and volatility. Growth (or decline) expressed as an average annual growth rate (AAGR) is the least squares growth rate, which takes into account all available datapoints over a period. The volatility of datapoints around a least squares growth trend over time is expressed via the coefficient of determination, or  $r^2$ . The most stable data series relative to the trend carries an  $r^2$  value of 1.0; the most volatile – 0.0. Growth calculated as a compound annual growth rate (CAGR) employs, by definition, only the first and last datapoints over a period. The CAGR is used to describe forecast growth, defined as the expected trend beginning in the base year and ending in the forecast year. Readers are encouraged to consider historical volatility when assessing particular annual values along the forecast trend, including in the forecast year.

For any given historical year, US dollar amounts are obtained from values expressed in applicable local currency. These local currency values are converted to US dollars using a constant 2016 exchange rate. For forecast years, the US dollar amounts assume the same

## About This Report

annual exchange rate as that prevailing in 2016. All value figures cited are in US dollars unless otherwise specified.

Key macroeconomic indicators are also provided with quantified trends. Other various topics, including profiles of pertinent leading suppliers, are covered in this report. A full outline of report items by page is available in the Table of Contents.

## Sources

*Industrial Enzymes: Canada* (FA35117) is based on *Global Industrial Enzymes Market*, a comprehensive industry study published by The Freedonia Group. Reported findings represent the synthesis and analysis of data from various primary, secondary, macroeconomic, and demographic sources including:

- firms participating in the industry, and their suppliers and customers
- government/public agencies
- national, regional, and international non-governmental organizations
- trade associations and their publications
- the business and trade press
- indicator forecasts by The Freedonia Group
- the findings of other reports and studies by The Freedonia Group

Specific sources and additional resources are listed in the Resources section of this publication for reference and to facilitate further research.
